

**uAvionix
MavLink OEM
Protocol
ICD**

Rev 1.20

February 17, 2021

1. Revision History

Revision	Date	Comments
1.19	2/10/2021	Updated static and dynamic exemplar message strings.
1.20	2/17/2021	Add identification message.

2. MavLink Public Specification

MAVLink documentation can be found at: <https://mavlink.io/en/>

3. Physical Interface

Communication to a uAvionix transponder is accomplished through a full duplex asynchronous serial interface. The interface should use 3.3v logic levels. The baud rate on the NAV interface is 115200bps and on the HOST interface 57600bps. Both interfaces, no parity, 1 stop bits and 8 data bits. Any multi-byte data is formatted and transmitted as little-endian.

Message ID	Description	I/O	Length	CRC Extra
66	DataStream Request	Out	6	148
246	Traffic Report	Out	38	184
203	Status	Out	1	85
202	Ownship	Out	42	7
202	Dynamic	In	42	7
202	Navigation	In	51	11
29	Scaled Pressure	In	14	115
201	Static	In	19	126
248	Identification	In	69	8

MAVLink Messages

4. Interface Priority

The two interfaces on the ping share a priority system based upon their intended purpose. This system provides prioritization and redundancy since the same information could be provided over either interface. Here is a list of required messages and timeout's for each interface:

Messages Required	Description	Timeout	Preferred/Backup Interface
MAVLink Static (ID: 201)	0.1Hz	30s	Host/NAV
MAVLink Dynamic (ID: 202)	5Hz	5s	NAV/Host

Interface Priority

When a particular message has not been received through the preferred interface for the specified timeout, the data being received from that message switches from the preferred interface to the backup interface.

5. DataStream Request Message

Message ID	66
Payload Length	6
CRC_EXTRA	148

This is a legacy MAVLink message to request telemetry position messages from Ardupilot. Prior to v3.7(arduplane) and 3.4(arducopter)

6. Traffic Report Message

Message ID	246
Payload Length	38
CRC_EXTRA	184

Position	Field	Type	Description
0	ICAO_address	uint32_t	ICAO Address
4	lat	int32_t	The reported latitude in degrees * 1E7
8	lon	int32_t	The reported longitude in degrees * 1E7
12	altitude	int32_t	Altitude in Meters * 1E3 (up is +ve) - Check ALT_TYPE for reference datum
16	heading	uint16_t	Course over ground in degrees * 10 ²
18	hor_velocity	uint16_t	The horizontal velocity in (m/s * 1E2)
20	ver_velocity	int16_t	The vertical velocity in (m/s * 1E2)
22	validFlags	uint16_t	Valid data fields
24	squawk	uint16_t	Mode A Squawk code (0xFFFF = no code)
26	altitude_type	uint8_t	Altitude Type
27	callsign	char[9]	The callsign
36	emitter_type	uint8_t	Emitter Category
37	tslc	uint8_t	Time since last communication in seconds

altitudeType	
0x00: PRESSURE_ALTITUDE (AMSL, QNH)	
0x01: GEOMETRIC (GNSS, WGS84)	
emitterType	
0x00: NO_TYPE_INFO	0x0A: LIGHTER_AIR_TYPE

0x0010: CALLSIGN_VALID	0x8000: SOURCE_UAT

7. Status Message

Message ID	203
Payload Length	1
CRC_EXTRA	85

Position	Field	Type	Description
0	status	uint8_t	Self test status.

status
0x00: INITIALIZING
0x01: OK
0x02: TX_FAIL_1090ES
0x04: RX_FAIL_1090ES
0x08: TX_FAIL_UAT
0x10: RX_FAIL_UAT

8. Dynamic / Ownship Message

Message ID	202
Payload Length	42
CRC_EXTRA	7

Position	Field	Type	Description
0	utcTime	uint32_t	UTC time in since GPS epoch (in s since Jan 6, 1980). If unknown set to UINT32_MAX.
4	latitude	int32_t	Latitude WGS84 (deg * 1E7). If unknown set to INT32_MAX
8	longitude	int32_t	Longitude WGS84 (deg * 1E7). If unknown set to INT32_MAX.
12	altPres	int32_t	Barometric pressure altitude relative to a standard atmosphere of 1013.2 mBar and NOT bar corrected altitude (meters * 1E3) UP +ve. If unknown set to INT32_MAX.
16	altGNSS	int32_t	Altitude (meters * 1E3). (up +ve). WGS84 altitude. If unknown set to INT32_MAX.
20	accHoriz	uint32_t	Horizontal accuracy(HFOM) (mm). If unknown set to UINT32_MAX.
24	accVert	uint16_t	Vertical accuracy(VFOM) (cm). If unknown set to UINT16_MAX.
26	accVel	uint16_t	Velocity accuracy (m/s * 1E3). If unknown set to UINT16_MAX.
28	velVert	int16_t	GPS vertical speed (m/s * 1E2). If unknown set to INT16_MAX.
30	nsVog	int16_t	North-South velocity over ground (m/s * 1E2) North +ve. If unknown set to INT16_MAX.
32	ewVog	int16_t	East-West velocity over ground (m/s * 1E2) East +ve. If unknown set to INT16_MAX.
34	state	uint16_t	ADS-B input flags.
36	squawk	uint16_t	Mode A code (typically 1200 [0x04B0] for VFR).
38	fixType	uint8_t	GPS Fix.
39	numSats	uint8_t	Number of satellites visible. If unknown set to UINT8_MAX.
40	emStatus	uint8_t	Emergency status (table 2-78 of DO-260B).
41	control	uint8_t	ADS-B transponder dynamic input control flags.

9. Navigation Data Message

Message ID	202
Payload Length	51
CRC_EXTRA	11

Position	Field	Type	Description
0	utcTime_s	uint32_t	UTC time since GPS epoch (in s since Jan 6, 1980). If unknown set to UINT32_MAX.
4	latitude	int32_t	Latitude WGS84 (deg * 1E7). If unknown set to INT32_MAX
8	longitude	int32_t	Longitude WGS84 (deg * 1E7). If unknown set to INT32_MAX.
12	altHAE_mm	int32_t	Altitude (meters * 1E3) UP +ve. Height above WGS-84 ellipsoid. If unknown set to INT32_MAX. Saturates at INT32_MAX-1.
16	altPres_mm	int32_t	Barometric pressure altitude (meters 1E3) UP +ve. If unknown set to INT32_MAX. Saturates at INT32_MAX-1.
20	horizontalPL_mm	uint32_t	Horizontal Protection Level (mm). If unknown set to UINT32_MAX. Saturates at UINT32_MAX-1. May report HPLsbas or HPLfd (see state bit 0x01).
24	verticalPL_mm	uint32_t	Vertical Protection Level (cm). If unknown set to UINT32_MAX. Saturates at UINT32_MAX-1. May report VPLsbas or VPLfd.
28	horizontalFOM_mm	uint32_t	Horizontal Figure of Merit, 95% (HFOM) (mm). If unknown set to UINT32_MAX. Saturates at UINT32_MAX-1.
32	verticalFOM_cm	uint16_t	Vertical Figure of Merit, 95% (VFOM) (cm). If unknown set to UINT16_MAX. Saturates at UINT16_MAX-1.
34	horizontalVelocityFOM_mmps	uint16_t	Horizontal Velocity Figure of Merit, 95% (HVFOM) (m/s * 1E3). If unknown set to UINT16_MAX. Saturates at UINT16_MAX-1.
36	verticalVelocityFOM_mmps	uint16_t	Vertical Velocity Figure of Merit, 95% (HVFOM) (m/s * 1E3). If unknown set to UINT16_MAX. Saturates at UINT16_MAX-1.
38	verticalVelocity_cmps	int16_t	GNSS vertical speed (m/s * 1E2). If unknown set to INT16_MAX. Saturates at INT16_MAX-1.
40	northVelocity_dmps	int16_t	North-South velocity over ground (m/s * 1E1) North +ve. If unknown set to INT16_MAX. Saturates at INT16_MAX-1.
42	eastVelocity_dmps	int16_t	East-West velocity over ground (m/s * 1E1) East +ve. If unknown set to INT16_MAX. Saturates at INT16_MAX-1.
44	utcTimeFractional_cs	uint8_t	Time (ms * 1E1) since UTC time mark. If unknown set to UINT8_MAX.
45	fixType	uint8_t	GNSS fix type, see table below.
46	navState	uint8_t	Navigation state, see table below.

47	satsUsed	uint8_t	Number of satellites in solution. Includes GNSS and GEO satellites. If unknown set to UINT8_MAX. Saturates at UINT8_MAX-1.
48	fwVersionMajor	uint8_t	Major FW version
49	fwVersionMinor	uint8_t	Minor FW version
50	fwVersionBuild	uint8_t	Build FW version

secondaryFwId=0xFF	secondaryHwId=0xFF
secondarySerialNumber=0xFFFFFFFFFFFFFFF	secondaryCRC=0xFFFFFFFF
secondaryFwParNumber=""	CRC=0xBC73

13. MAVLink Protocol Frame Format

Each message will be formatted into a frame for transmission across the physical interface. Each frame must be transmitted in its entirety with the start of the frame being inferred by the beginning of any transfer initiated after the end of a previous frame. The end of a Frame will be delineated with an idle condition on the interface.

The uAvionix transponder is 'stateless' MAVLink packets do not have to be coordinated.

Ping OEM Frame 8 - 263 bytes:

STX	LEN	SEQ	SYS	COMP	MSGID	PAYLOAD	CKA	CKB
-----	-----	-----	-----	------	-------	---------	-----	-----

Byte Index	Content	Value	Description
0	Packet Start Flag	0xFE	Indicates the start of a new packet
1	Payload Length	0 - 255	Indicates the length of the payload
2	Packet Sequence	0 - 255	Send sequence. Allows to detect packet loss
3	System ID	0 - 255	ID of the Sending system. Allows to differentiate different PINGs on the same network
4	Component	0 - 255	ID of the Sending Component.
5	Message ID	0 - 255	ID of the Message - the 'id' defines what the payload "means" and how it should be correctly decoded.
6 to (n+6)	Data	0 - 255 Bytes	Message Data
(n+7) to (n+8)	Checksum (low Byte, high Byte)	ITU X.25/SAE AS-4 hash, excluding packet start flag, so bytes 1..(n+6) Note: The checksum also includes CRC_EXTRA	

14. CRC Source Code Example

CRC Code:

Code to validate the packet CRC.

```
#define X25_INIT_CRC 0xffff
#define X25_VALIDATE_CRC 0xf0b8

/**
 * @brief Accumulate the X.25 CRC by adding one char at a time.
 *
 * The checksum function adds the hash of one char at a time to the
 * 16 bit checksum (uint16_t).
 *
 * @param data - New char to hash
 * @param crcAccum - Already accumulated checksum
 */
void crc_accumulate(uint8_t data, uint16_t *crcAccum)
{
    // Accumulate one byte of data into the CRC
    uint8_t tmp;

    tmp = data ^ (uint8_t)(*crcAccum&0xff);
    tmp ^= (tmp<<4);
    *crcAccum = (*crcAccum>>8) ^ (tmp<<8) ^ (tmp<<3) ^ (tmp>>4);
}
#endif

/**
 * @brief Initialize the buffer for the X.25 CRC
 *
 * @param crcAccum - 16 bit X.25 CRC
 */
void crc_init(uint16_t *crcAccum)
{
    *crcAccum = X25_INIT_CRC;
}

/**
 * @brief Calculates the X.25 checksum on a byte buffer
 *
 * @param pBuffer - buffer containing the byte array to hash
 * @param length - length of the byte array
 * @return the checksum over the buffer bytes
 */
uint16_t crc_calculate(const uint8_t *pBuffer, uint16_t length)
{
    uint16_t crcTmp;
    crc_init(&crcTmp);
    while (length--) crc_accumulate(*pBuffer++, &crcTmp);
    return crcTmp;
}

/**
 * @brief Accumulate the X.25 CRC by adding an array of bytes
 *
 * The checksum function adds the hash of one char at a time to the
 * 16 bit checksum (uint16_t).
 *
 * @param data - New bytes to hash
 * @param crcAccum - Already accumulated checksum
 */
void crc_accumulate_buffer(uint16_t *crcAccum, const char *pBuffer, uint16_t length)
{
    const uint8_t *p = (const uint8_t *)pBuffer;
    while (length--) crc_accumulate(*p++, crcAccum);
}

// @param 2 (&msg + 1) to start CRC at LEN not STX.
// @param 3 Must add 5 to the payload message length to perform checksum across LEN, SEQ, SYS, COMP, MSGID and
// PAYLOAD.
crc_accumulate_buffer(&msg->checksum, &msg + 1, msg->len + 5);
// Note CRC_EXTRA is defined for each individual packet in the document.
crc_accumulate(CRC_EXTRA, &msg->checksum);
ck_a(msg) = (uint8_t)(msg->checksum & 0xFF);
ck_b(msg) = (uint8_t)(msg->checksum >> 8);
```
